How to use

Voxel Palette uses special data-objects to store settings of different palettes. Its type name is **ColorPalette**. To create new Color Palette, press **RMB** in **Project Window** and select **Insane Systems -> Voxel Palette -> Color Palette**.

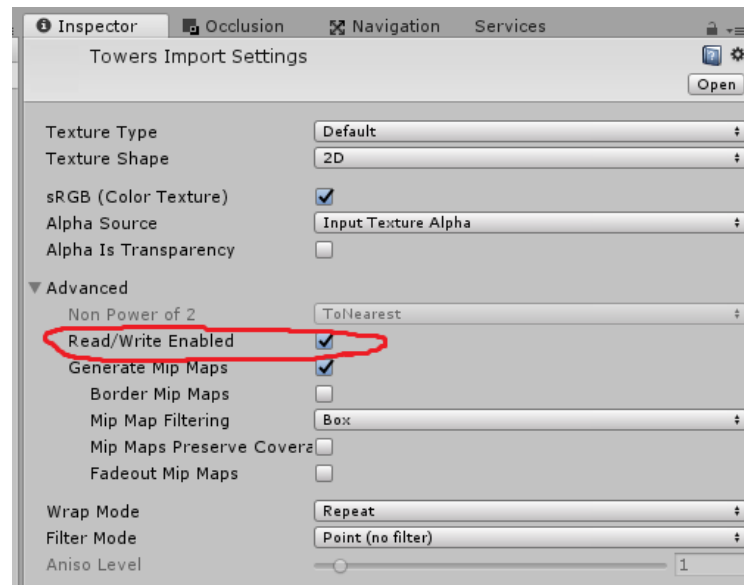

Example **Color Palette** file stored in InsaneSystems/VoxelPalette/Resources/Data.

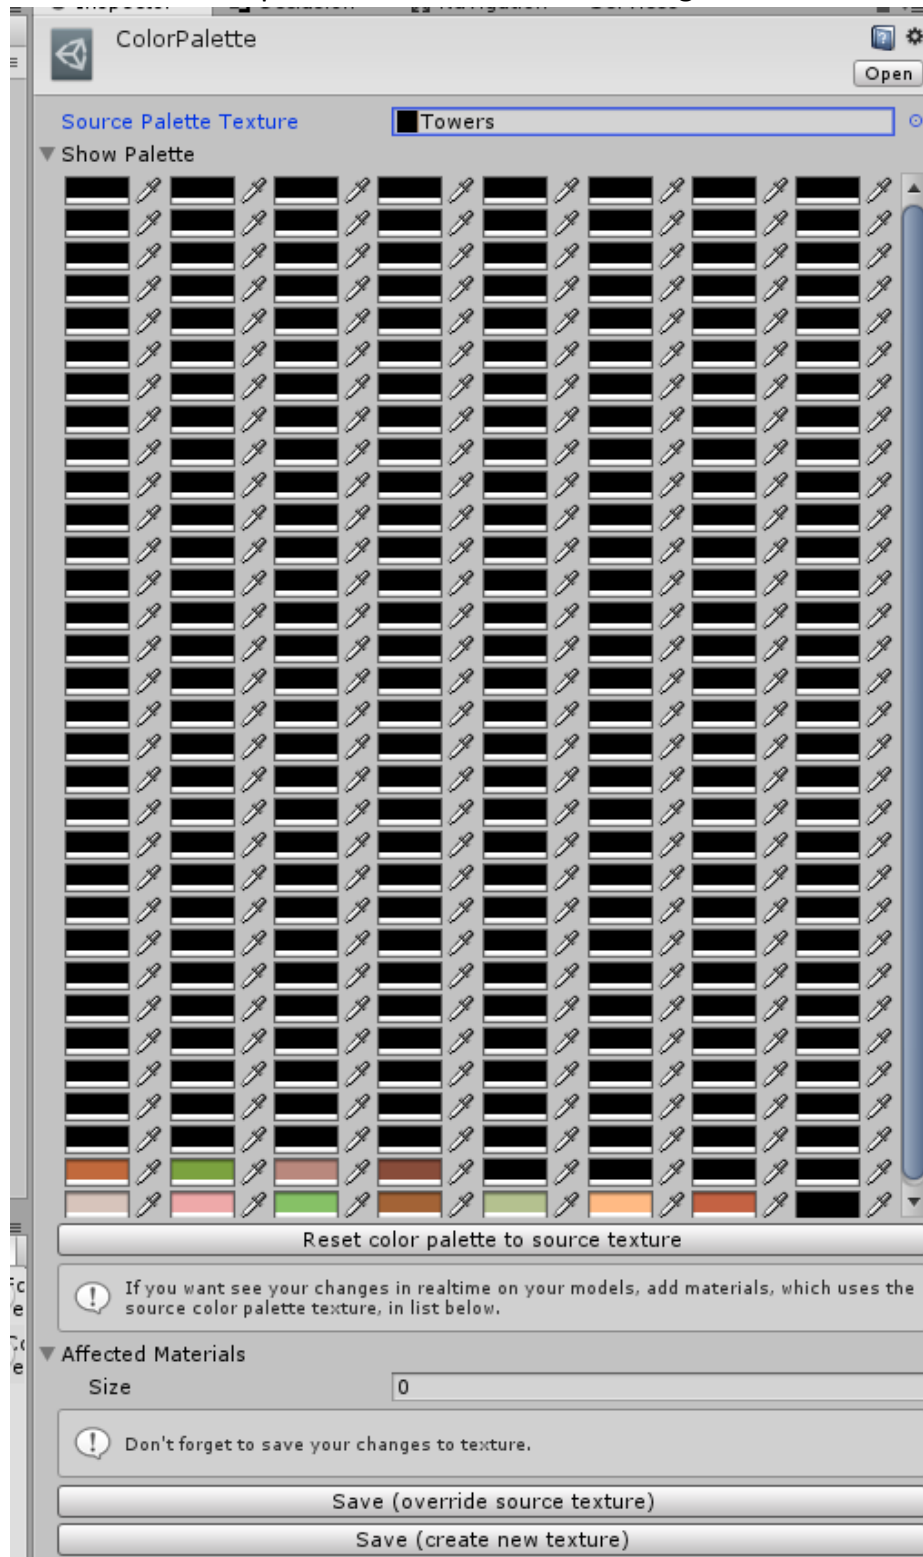

After selection of created file, you will see this:

You need to drag'n'drop or select texture with color palette of your models in **Source Palette Texture** field. But first you need to make your color palette texture **Read/Write Enabled**:

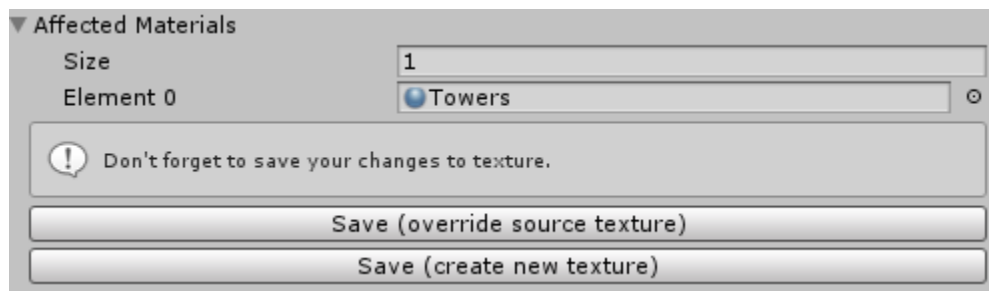

After doing this and adding this texture to the **Color Palette** data file field, It will generate editable color palette and show other settings of **Color Palette** data:

Note, that in my palette a lot of empty colors, but if you able to use and edit all 256 colors (or any other count, which presented in your own texture palette).

Now you can edit any color of palette in **Unity Editor**. If you're make a mistake, you always can click "Reset color palette to source texture", to restore all colors from source texture.

To see your changes in realtime on scene, you need to add all materials, which uses the source color palette texture in **Affected Materials** field (it is simple array/list):

Also adding materials needed to instantly apply changes for all materials after saving result of your work.

After editing colors, when you're get needed result, you need to save result of your work. There two options:

- **Save to source texture with override.** It will change source texture, so use it on your risk.
- **Save to new texture.** It will create new color palette texture, copy of source but with your changes. Texture will be created in **Assets/Resources/** folder. If you have suggestions about place, which location for new textures will be better – please, contact me.
